# INTEGRATION IS THE REVERSE OPERATION OF DIFFERENTIATION.

If we differentiate the function:

$$F(x) = x^2 \text{ this gives } \frac{dy}{dx} = 2x.$$

The integration is the reverse process which means:

From the derivative  $2x$ , integration allow us to work out the  $F(x)$ .

It is written as:

$$\int 2x \, dx = x^2 + c$$

It means the integral of  $2x$  with respect to  $x$  is  $x^2$ .

# DEFINITE INTEGRALS

This is a representation of generic function  $f(x)$ , we want to calculate the area under the curve between  $x=a$  and  $x=b$ . It can be calculated by:

The function:

$$\int_a^b f(x) dx$$

It is a definite function to solve it, we use the formula:

$$\int_a^b f(x) dx = [F(x)]_a^b = F(b) - F(a)$$

# DEFINITE INTEGRALS

The function:

$$\int_a^b f(x) dx$$

It is a indefinite function to solve it, we use the formula:

$$\int_a^b f(x) dx = [F(x)]_a^b = F(b) - F(a)$$
